IMS	**IMS Infrastructure Management Services, LP**
IRI	**International Roughness Index**
L&T	**Longitudinal and transverse**
LAD	**Load-associated distresses**
LCMS-2	**Laser Crack Measuring System, 2nd evolution**
NLAD	**Non-load associated distresses**
PCI	**Pavement Condition Index**
PMP	**Pavement management plan**
QC	**Quality Control**
RST	**Road Surface Tester**

1 EXECUTIVE SUMMARY

Near the end of 2022, IMS Infrastructure Management Services, LP (IMS) was contracted by the City of Glendale, AZ (City) to perform a comprehensive automated pavement condition survey on its 774 centerline miles of asphalt and concrete pavements. IMS utilized a cutting-edge Road Surface Tester (RST) (**Figure 1**) to capture continuous, high-resolution data on pavement cracking, rutting, and roughness. Data collection was overseen by an IMS technician trained in the use of downward pointing lasers, HD cameras, GPS, profilers, and other equipment necessary to obtain accurate information about the City's network condition.

Figure 1 - IMS Road Surface Tester (RST)

IMS followed the ASTM D6433 standard to analyze the images and surface distress data to determine the Pavement Condition Index (PCI), a score of 0-100, with 100 representing the best possible condition and 0 representing the worst possible condition. The PCI values are based on the observed surface distresses and provide an indication of the functional and structural performance of a pavement. The range is commonly divided into categories using descriptive terms: *Failed (0-25)*, *Very Poor (25-40)*, *Poor (40-50)*, *Marginal (50-60)*, *Fair/Critical (60-70)*, *Good (70-82)*, and *Excellent (82-100)*. Divisions between the terms are not fixed but are meant to reflect common perceptions of pavement conditions. In addition to the PCI, IMS also collected and determined the International Roughness Index (IRI) , a measure of ride quality, following the ASTM E1926 standard for each road segment.

IMS implemented the PAVER pavement management system, incorporating available historical survey and maintenance and rehabilitation (M&R) data, including recent slurry seal projects. PAVER is a tool that allows the City to develop and organize its pavement inventory, assess the current conditions, and then develop models to predict future conditions. This system is capable of developing scenarios based on budget or condition requirements, suggesting rehabilitation plans and priorities based on a cost-effective approach to pavement management.

In September 2023, IMS developed multi-year pavement M&R recommendations for the City. These recommendations were based on data from surveys completed in December 2022 and the available

work history. For segments that had received a slurry seal in the past 3 years, PAVER program's estimated benefits (5 years credit) were used to project the PCI. For the remaining segments, the 2022 survey data were utilized.

Slurry seals should only be used on roads in good condition with minimal structural defects. If applied as a quick fix to *Poor* pavements without addressing underlying structural defects, slurry seals, while providing a short-term improvement to road surfaces, might lead to the reappearance of these defects sooner than expected. In this case, the underlying structure and base deteriorates at a faster rate, which must be accounted for to get a realistic overall PCI of the roadway. The City continues to monitors the effectiveness, proper application, and performance of this preventive maintenance strategies in its network.

Based on this approach, the City's roadways were found to be in *Marginal* condition **with an average PCI of 58**. **Figure 2** illustrates the distribution of pavement conditions in the City. Approximately 14% of the City's roadways were deemed to be in *Excellent* condition only requiring routine maintenance. About 37% of the pavements were categorized as either *Good* or *Fair/Critical* condition. If structurally sound, these pavements are often suitable candidates for cost-effective preventive maintenance treatments like slurry seals. On the opposite end of the spectrum, roughly **24%** of the pavements had a PCI below 40 (i.e., pavements in *Failed* or *Very Poor* condition) typically necessitating full or partial reconstruction. These pavements cost the City about $133M to reconstruct. Pavements falling within the middle categories, such as *Poor* or *Marginal* condition, often benefit from mill and overlay projects. It's important to note that these are general recommendations, and the specific M&R strategy may vary based on factors such as distress types, soil conditions, structural adequacy, and other project-specific details.

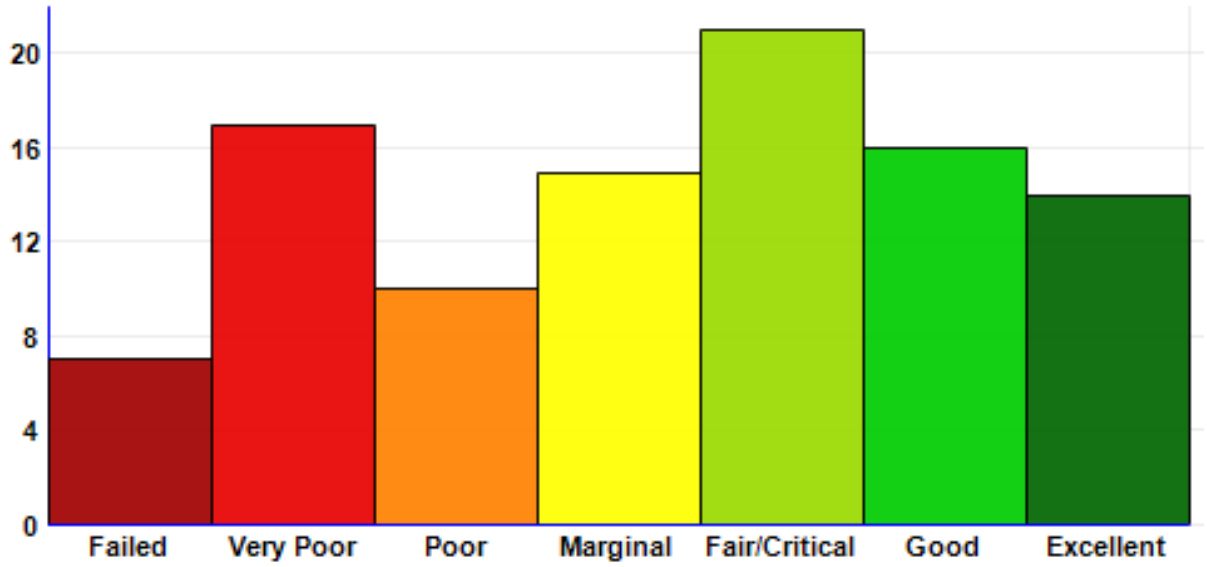

Figure 2 – Distribution of the City's Pavement System Using Descriptive Conditions

To assess the effect of annual budget on PCI over a five-year and ten-year period, PAVER program was used to generate various scenarios based on potential goals or annual budget allocations.

With the City's current variable annual funding averaging $30 million (including pavement management plan (PMP) budget and Bonds), the City is projected to achieve a PCI of 63 in 5 years and a PCI of 70 in 10

years. The City's goal is to improve pavement conditions to *good* condition (70-82), to reduce expenses and optimize its budget for extending the pavement's lifespan. To reach PCIs of 72 and 82 within a decade, the City would need to allocate approximately $31 million and $36 million annually, respectively. Achieving these targets within a shorter 5-year period would require an annual budget increase to around $42 million and $52 million, respectively. It is important to note that these projections are estimated using 5% annual inflation rate.

To get the most return on investment, IMS presents the following recommendations based on the data analysis outcome:

- Continue dedicating a portion of funding to inexpensive preventive maintenance activities, such as slurry seals; and continuously monitor their short- and long-term benefits in the network. For these activities, make sure to apply them on good roads with minimal structural defects or properly address the structural deficiencies through localized patching and crack sealing prior to slurry seal application. An illustration of these projects mapped to their associated segments can be found in **Appendix A** and a list of recommended projects can be found in **Appendix C**.
- Concentrate rehabs on the critical PCI candidates selected by PAVER for various work categories. PAVER recommendations are focused on roads that are at their "Critical PCI" point. These are roads that will soon deteriorate to a point where heavier rehabilitation may be necessary.

This approach allows for a gradual increase of the network's average PCI and decrease of the roads in *Poor* or worse condition.

The information in the executive summary is condensed from various sections of this report. Reviewers are encouraged to familiarize themselves with the detailed information provided in subsequent sections of the report prior to making any specific decisions based on these results. This will ensure that decisions regarding M&R activities are based on a comprehensive understanding of the conditions of the roadways and the recommendations provided in the report.

2 PRINCIPLES OF PAVEMENT MANAGEMENT

This section provides an overview of pavement management, including its objectives and the best practices for M&R planning throughout the lifecycle of a pavement. It also highlights the integration of these concepts in the PAVER pavement management system, which was used in this report to develop recommendations and analyze the City's pavement network. This context is important for understanding the content and findings of the report.

2.1 Pavement Management Principles

Pavement management is the process of assessing, prioritizing, and preserving or rehabilitating pavements through a logical system that attempts to use available funds in the most cost-effective manner possible. The process is iterative, and as more data becomes available, prediction models are refined to improve accuracy. **Figure 3** illustrates that pavements typically start deteriorating rapidly once they hit a specific threshold. Therefore, it is more cost-effective to invest in cheaper surface treatments during the first 40% of a pavement's lifespan than to defer maintenance until heavier overlays or reconstruction is required just a few years later. Streets that are repaired while in good condition will have an extended lifespan and will cost less to maintain over their lifetime than those left to deteriorate to a poor condition. Without an adequate routine pavement maintenance program, streets will require more frequent reconstruction, thereby requiring significantly greater funding.

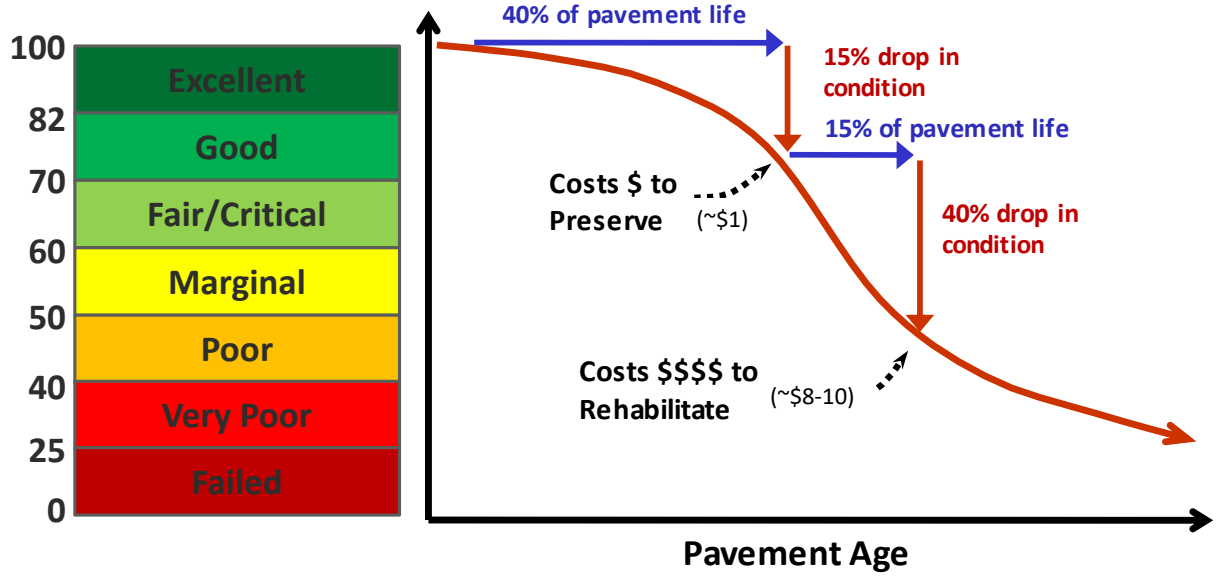

Figure 3 **- Pavement Deterioration and Life Cycle Costs**

The types of rehabilitation activities that the City chooses to deploy based on the suggestions provided by this report can have a significant effect on the longevity of a pavement. Depending on the PCI zone in which a pavement falls, a detailed rehabilitation strategy needs to be formed. Common rehabilitation types include:

- **Localized preventive or stop gap activities**: crack sealing, joint sealing, and patching
- **Global preventive maintenance**: fog seals, rejuvenators, slurry seals, microsurfacing, chip seals, cape seals, and thin overlays
- **Major rehabilitation**: thin or thick mill and overlays
- **Major reconstruction**: surface reconstruction or full reconstruction

A proactive Pavement management program focuses on the Preventative Maintenance category and advocates proper incorporation and application of cost-effective preventative activities. These activities help maintain the surface integrity which can slow deterioration and, depending on the treatment, also extend the life of a pavement. The outcome of this exercise is to increase long-term cost savings and network-level pavement quality over time. **Figure 4** illustrates the concept of extending pavement life through the application of timely M&R activities.

When completed within the target zone for preventative maintenance, a pavement's lifespan can be conveniently extended using pavement preservation and rehabilitation. The dotted curves in **Figure 4** show the typical lifespan of a pavement that does not undergo any preventive maintenance. Major reconstruction becomes necessary after approximately 20 years. The blue curves show the benefits of preventive maintenance during the first 40% of a pavement's lifespan. The distance between the initial curve and the second one that is generated after preventative maintenance can be seen as the increase in overall pavement life. Eventually, all pavements will need to undergo reconstruction; however, proactive preventive maintenance and timely rehabilitation can delay this process for up to an additional 40 years.

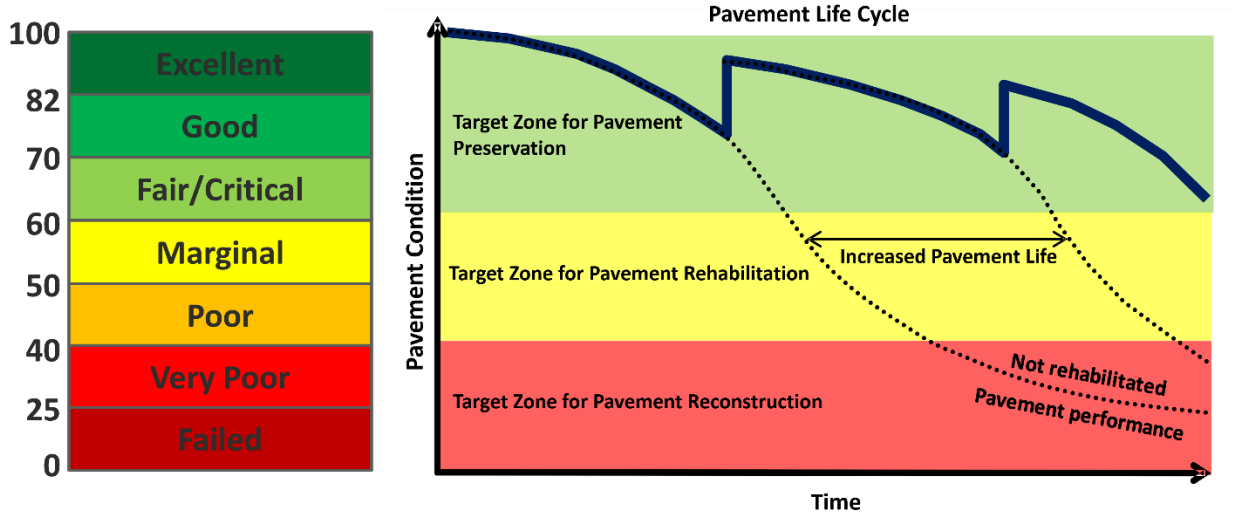

Figure 4 - Pavement Life Cycle Curve

The most effective approach to ensure optimal usage of available funds or to determine the necessary funding to achieve a predetermined level of service is by using PAVER pavement management system. PAVER can assist agencies in developing an organized catalog of pavement assets, storing periodic condition assessments, and tracking spending and costs. This enables the City to compare trends in data to assess the effectiveness of maintenance activities and new technologies.

3 DATA COLLECTION AND ANALYSIS

3.1 Field Survey Methodology

IMS deployed one of its Road Surface Tester (RST) vehicles outfitted with the second evolution of Laser Crack Measuring System (LCMS-2) to perform continuous data collection as part of the automated pavement condition survey. An overview of the vehicle is provided in **Figure 5**.The vehicle is equipped with two downward LCMSs mounted at the rear of the vehicle that provide 3D, high-speed mm-level scanning and pattern recognition analysis. This provides a higher level of detail for the determination of crack length and width measurement over the sample area. The RST also has a high resolution, high accuracy inertial profiler that uses point lasers to measure pavement ride quality. The vehicle is also equipped with a high-accuracy GPS device and several high-definition 4k cameras that collect forward, downward, and rearward images.

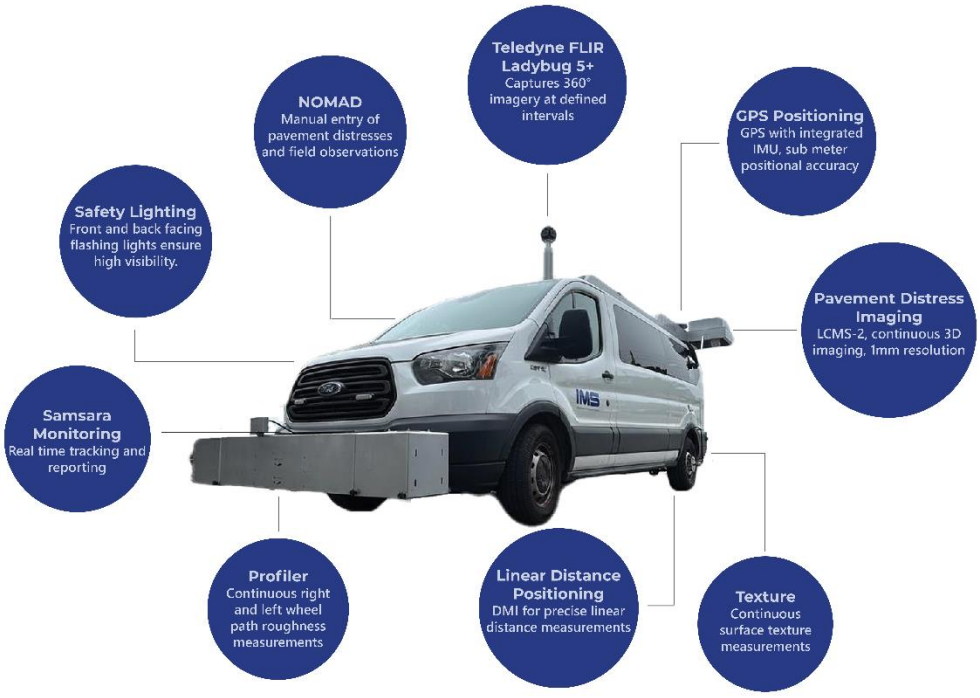

Figure 5 - LCMS-2 data collection vehicle

Although the LCMS-2 automatically detects most visible distresses, the RST platform utilizes highly trained IMS technicians who aid in data validation and propose additional changes in observed distress severities and extents when necessary. They also identify specific roadway assets or attributes, such as curb reveal or lip of gutter information, using a touchscreen-based tablet computer connected to the on-line data flow through time code, GPS, a Distance Measuring Instrument (DMI), and inventory control. The data is then processed in the IMS office to generate extent quantities for each observed distress severity level which are then used to calculate a PCI.

3.2 Data Quality Assurance

To ensure the accurate determination of PCI scores, the field data is subject to rigorous quality checks. The first phase is a rule-based check that flags roads based on expected outcomes that are gathered from the automatic crack detection and processing parameters. These parameters are those used to convert the LCMS-2 data into severity and extent data. The output then identifies areas that are within the sample area but should be excluded from the assessment. Examples are highlighted in **Figure 6**. These include the edge of a pavement or curb (purple and green highlight), manhole covers and inlets (red box), and pavement markings (yellow highlight). This output is combined with information from our field raters about distresses that may not be present in a traditional manner or may be outside the guidelines set forth in ASTM D6433.

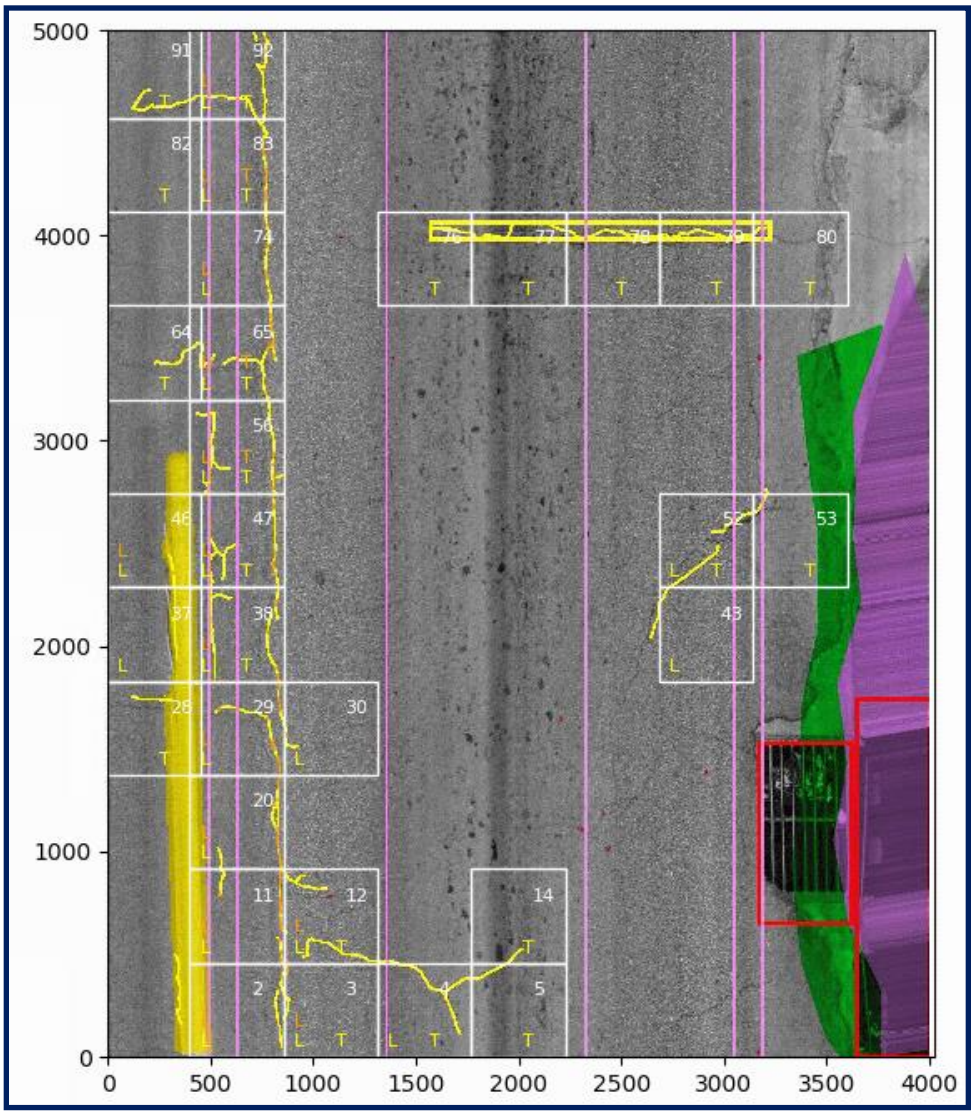

Figure 6 - Processed LCMS-2 Image with a mm Scale

Following the rule-based check, a second review is then performed by a team of highly trained raters who are well-versed in both the distress standards and the data in its digital format. This Quality Control (QC) team employs a systematic approach to ensure that every aspect of the data is thoroughly reviewed. They begin by examining the identified distresses in the LCMS data and comparing them to the 4K images captured by the HD cameras during the survey. An example of what this process looks like is provided in **Figure 7**. This allows the QC team to identify any discrepancies and make the necessary corrections to ensure that the data accurately represents the condition of the road.

Figure 7 - QC Image

To further confirm the accuracy of our condition data, spot checks are conducted on a network-wide basis by both the QC team and engineering staff. These spot checks are carried out on a random selection of road sections across the entire network. The purpose is to verify that the condition data collected by the LCMS and field raters is consistent and accurate throughout the network. They also help to identify any potential issues that may have been missed during the initial data collection and review process.

Once the QC team and engineering staff have established the integrity of the data, an initial condition sheet is prepared and submitted for review by City staff. This review process involves a careful examination of the condition data and includes a comprehensive analysis of the data's completeness, accuracy, and consistency.

3.3 Pavement Condition Survey

The goal of the pavement condition survey is to determine an accurate rating for each pavement section. The process of collecting and assessing data involves both automated and manual observations that originate from the data collected with the RST LCMS-2 downward imaging lasers, an array of 4k cameras, and trained rating personnel.

Pavement Condition Index (PCI)

ASTM D6433 provides a method of categorizing surface distress observations for both asphalt and concrete pavements, based on the extent and severity of distresses along the roadway. The PCI is used to represent the observed pavement defects on a scale from 0 to 100. However, not all surface distresses are given equal weight. Load-associated distresses (LAD), such as rutting or alligator cracking on asphalt streets, and divided slabs on concrete streets, have a greater impact on the PCI than non-load associated distresses (NLAD), such as raveling or longitudinal and transverse cracking. Even when present in low extents and moderate severity, LAD can significantly decrease the PCI. The rating systems also incorporate algorithms to correct for multiple or overlapping distresses within a segment, as a single cause can lead to several types of distress. The PCI inputs are shown in **Figure 8**.

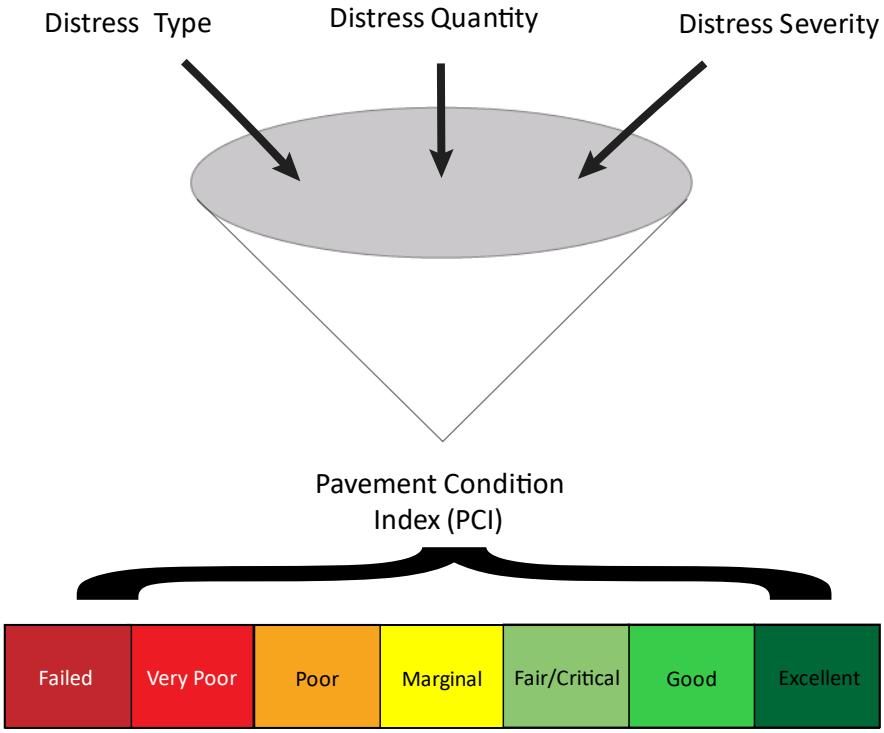

Figure 8 - PCI Inputs and Detailed Scale

ASTM D6433 covers nearly forty unique distress types that may or may not be present in a city's road network. For that reason, IMS uses a modified approach that collects the most common and relevant distresses. The descriptions in **Table 1** outline some of the distresses collected for the City.

Table 1 - Distress Descriptions

Distress Type	Pavement Type	Description	Example
Alligator Cracking	Asphalt	• Quantified by severity and square footage • Caused by the repeated bending from vehicle loads • Propagate from the bottom, meaning that structural failure has occurred • An LAD with significant impact on the condition score, even at low extents	
Rutting	Asphalt	• A minimum depth of ¼ inch • Quantified by their depth and square footage • Caused by the permanent deformation of the pavement and/or subgrade layers • Low densities can have a large impact on the final condition score due to their implication of possible structural failure	
Longitudinal & Transverse Cracking	Asphalt	• Quantified by their length and width • Results from pavement shrinkage due to natural daily and seasonal temperature cycles, construction issues, or other factors	

Distress Type	Pavement Type	Description	Example
Block Cracking	Asphalt	• Quantified by their width and square footage • Form interconnected longitudinal and transverse cracks • Divides the pavement into rectangular pieces • Results from aging and environmental factors	
Patching	Asphalt	• Quantified by the square footage and severity • Always considered a surface defect • Affects ride quality and condition of a pavement	
Raveling	Asphalt	• Loss of coarse aggregate on pavement surface • Measured by severity and square footage affected	

Distress Type	Pavement Type	Description	Example
Bleeding	Asphalt	• Presence of free asphalt binder on the roadway surface • Caused by either an excess of asphalt in the pavement or insufficient voids in the matrix • Results in a pavement surface with reduced skid resistance • Measured by severity and square footage	
Edge Cracking	Asphalt	• Run parallel to the road, usually within 1 to 2 feet of the outer edge of the pavement • Caused by traffic loading and weakened base conditions resulting from poor drainage • Measured in linear feet	
Distortion	Asphalt	• Includes various localized unevenness in the surface • Examples include bumps and sags, depressions, swell, corrugation, and shoving • Caused by several factors, such as construction issues, subgrade failure, mixture failure, environmental influence, etc.	

Distress Type	Pavement Type	Description	Example
Weathering	Asphalt	• Wearing away of asphalt binder and fine aggregate matrix • Quantified by severity and square footage	
Divided Slab	Concrete	• Slab divided by cracks into four or more pieces • Caused by overloading, inadequate support, or both • Categorized as a severe corner break if all pieces or cracks are contained within a corner break	
Corner Breaks	Concrete	• Crack that intersects with a joint at less than ½ the slab length • Cracking extends vertically through the entire slab thickness • Typically caused by repeated load on a surface with a failing base	
Joint Spalling	Concrete	• A breakdown of the edges of a slab within 2ft of a joint • The depth of the cracking and area affected determine the severity	
Faulting	Concrete	• Identified by a difference in elevation across a joint • Severe faults have a >3/4 inch elevation	

Distress Type	Pavement Type	Description	Example
		difference between two adjacent concrete slabs	
Durability Cracking	Concrete	• Caused by the freeze-thaw expansion of the large aggregate • Breaks down concrete over-time • Typically runs parallel to a joint or linear crack • A high severity "D" crack covers more than 15% of the overall slab	
Scaling	Concrete	• A result of the surface layer of concrete being worn away over time by weathering • A ¼ to ½ inch breakdown in the surface • Measured by severity and total area affected	
Punchouts	Concrete	• A localized, broken area of the slab • Caused by heavy and repeat loads, inadequate slab thickness, and a deterioration of the base foundation • Measured by severity and number of individual cracks within the distress	

Table 2 presents each PCI category along with a brief description of the typical distresses and recommended treatments for each.

Table 2 – Pavement Condition Categories

Category	Typical Distresses and M&R Recommendations	PCI Range
Excellent	Like-new pavement **Preventative Maintenance:** *Crack Sealing*	82<PCI≤100
Good	Low severity longitudinal and transverse (L&T) cracking and weathering **Preventative Maintenance:** *Crack Sealing & Surface Treatments*	70<PCI≤82
Fair/Critical	Moderate severity L&T cracking **Global preventive maintenance & localized repairs:** *Localized surface and/or full-depth patching, surface treatments, and thin overlays*	60<PCI≤70
Marginal	Severe L&T cracking, low severity alligator cracking **Moderate rehabilitation:** *Localized full-depth patching, mill and overlays*	50<PCI≤60
Poor	Moderate alligator cracking **Major rehabilitation:** *Mill and overlays, and surface reconstruction*	40<PCI≤50
Very Poor	Severe alligator cracking, rutting **Major rehabilitation:** *Partial and complete reconstruction*	25<PCI≤40
Failed	Severe alligator cracking, rutting, and potholes **Major rehabilitation:** *Complete reconstruction*	0<PCI≤25

International Roughness Index (IRI)

The International Roughness Index (IRI) provides a quantifiable measure of ride quality and is determined based on the ASTM E1926. This value is derived from the longitudinal profile captured by the IRISPro Inertial Profiler as it records the change in elevation over a distance. Once calculated, it is expressed as a slope and reported in millimeters per meter (mm/m). Typical IRI levels for new, older, and damaged pavements are displayed in **Figure 9.** A lower IRI is typically expected and required for pavements that are used for higher speed travel.

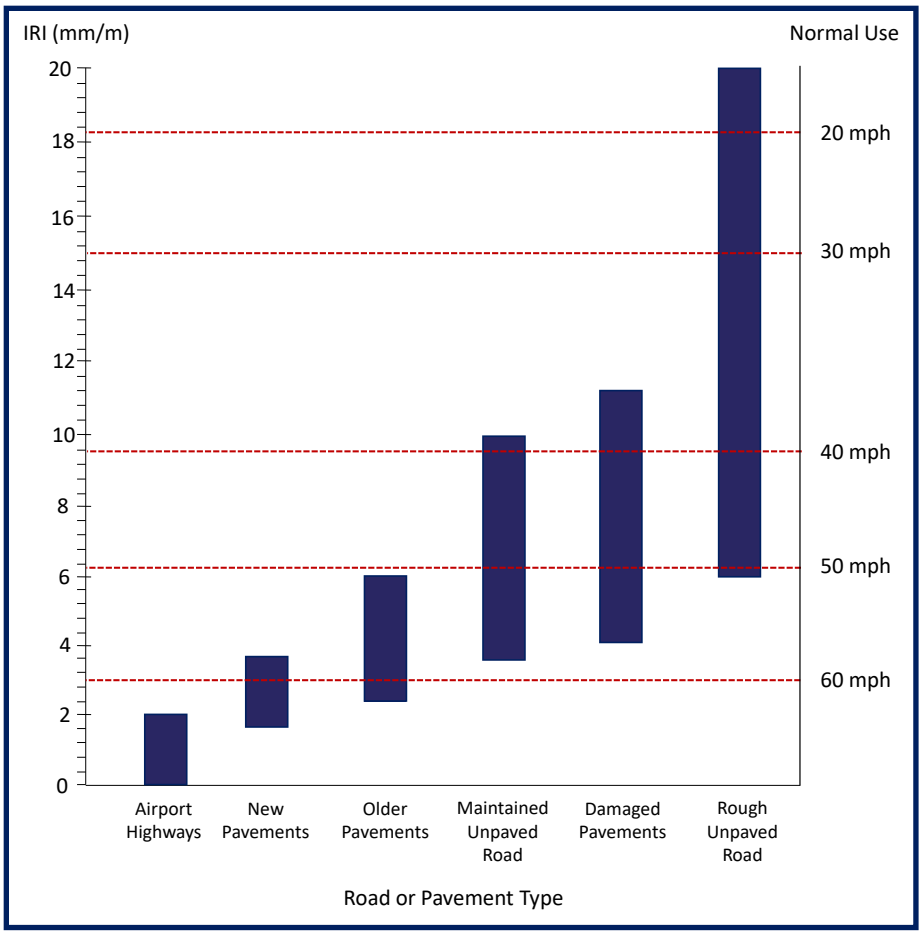

Figure 9 - IRI Scale Definitions

To provide some context, a smooth road typically has an IRI value of below 3.2 mm/m (200 in/mile), whereas a street with a marginally rough surface would fall within the range of 3.2 mm/m to 6.3 mm/m (200-400 in/mile). Roadways with rough ride generally have IRI values above 6.3 mm/m (400 in/mile). While newly constructed roads are typically expected to have a smooth ride, rapid construction can lead to a pavement surface with less-than-optimal smoothness, resulting in a higher IRI value. Similarly, poorer roads with a lot of distresses could sometimes be smoother than expected. Ultimately, IRI can be used as a secondary factor especially for higher speed roads such as arterials and collectors when considering M&R strategies to select the most problematic roads within the agency.

For analysis purposes, the IRI value is converted to a numerical representation that aligns with the scale used for the PCI. This is achieved by converting the IRI value into a score on a scale from 0 to 100 and reporting it as the Roughness Index (RI) using the following formula.

$$\mathbf{RI} = (11 - 3.5 \times \ln(\mathrm{IRI})) \times 10$$

ln(IRI) is the natural logarithm of IRI.

As displayed in **Table 3**, RI values below 40 are considered rough, those above 70 are considered smooth, and those between 40-70 are considered to be marginally rough. A newly constructed street would typically have an RI value of above 85, whereas a street that requires an overlay would fall within the range of 40 to 70. Roadways in poor condition generally have RI values below 40, although they may achieve higher PCI scores if the distresses responsible for the low RI score are not due to structural failure

or other severe causes. For instance, rapid construction can lead to a pavement surface with less-than-optimal smoothness, resulting in a low RI value. However, since the distress or imperfection is not caused by severe failures within the pavement structure, the PCI value may not be significantly affected.

Table 3 – IRI and RI Condition Categories

Category	IRI Range (in/mi)	RI Range
Smooth	0≤IRI≤200	70<RI≤100
Marginally Rough	200<IRI≤400	40<RI≤70
Rough	400<IRI	0<RI≤40

3.4 PAVER Pavement Management System

PAVER is a widely used pavement management software package developed by the U.S. Army Corps of Engineers' Construction Engineering Research Laboratory. The software package includes a set of engineering tools that assists agencies in determining when, where, and what level of pavement M&R is required and approximately how much it will cost. The system provides a suite of pavement management tools, or "modules", that will help the City with the following tasks:

- Developing and organizing their pavement inventory.
- Assessing the condition of their pavements through time.
- Keeping track of the historical M&Rs performed in the network.
- Developing models to predict the current and future pavement conditions.
- Developing scenarios for M&R based on either funding or pavement condition goals.
- Planning M&R projects.

The PAVER User Manual, which is available as a navigable PDF file in the PAVER software provides more details on various functionalities of the program.

3.5 Summary

This section outlined the fundamental concepts of pavement management and described the implementation process for the City's pavement management system. The operating parameters of PAVER were reviewed, and the inputs provided by the LCMS-2 technology were explained to provide context for calculating PCI, Roughness Index, and Pavement Structural rating.

4 PAVEMENT CONDITION SURVEY RESULTS

This section will review the network level pavement conditions as of September 2023 determined based on pavement condition surveys performed in 2022 and 2019. Data from 2022 was included in the analysis for segments of pavement that did not receive a slurry seal in the past three years, while data from 2019 was used for segments of pavement that did receive a slurry seal in the past three years implementing the PAVER estimated 5-year credit of such activities. All segments were then deteriorated using the defined pavement deterioration models to reflect the conditions of the roadways at the time of analysis (September 2023).

This approach was used due to a significant short-term increase in the PCI of slurry-sealed roads and concerns about the long-term effectiveness and performance of slurry seals. Slurry seals should only be used on roads in good condition with minimal structural defects. When used as a temporary solution on *Poor* pavements without addressing the underlying structural issues, slurry seals can provide short-term improvement to the road surface condition. However, this use of slurry seals may result in a deceptively high PCI score and might also lead to the reappearance of these defects sooner than expected; therefore, necessary adjustments were made to the life cycle curves of these pavements. The City continues to monitor the effectiveness, proper application, and performance of this preventive maintenance strategy in its network.

This section includes a summary of conditions in the functional classes used in the City's analysis, followed by a review of network photos taken from the RST. A series of charts will then summarize the findings of the condition survey and provide an overview of the PCI distribution across the City's pavement network.

4.1 City Network Condition Imagery

The images presented in this section provide a sampling of the City's streets that fall into various condition categories. A discussion of potential rehabilitation strategies is included for each category.

Failed (PCI = 0 to 25) – Complete Reconstruction

Bethany Home Rd from N Mobile Home Park to N 49th Ave (GISID 1515, PCI = 19) – Rated as *Failed*, this street displays a large quantity of severe alligator cracking severe enough to suggest that the pavement structure is inadequate for current traffic loads. The rehabilitation of roads in this condition through a mill and overlay is generally ineffective, as the failures usually extend to the bottom of the pavement layer. Streets in this condition require rehabilitation that involves removal and replacement of the asphalt layer, base stabilization, or complete reconstruction based on design requirements.

Deferral of reconstruction of streets rated as *Failed* will not cause a substantial decrease in overall pavement quality. The streets have passed the opportunity for overlay-based strategies, meaning that reconstruction, which can be expensive, is the most suitable solution. Thus, *Failed* streets are often deferred in favor of rehabilitating more streets at lower costs, resulting in a greater net benefit to the City. This type of street can pose a safety hazard for motorists though since severe potholes and distortions may develop. It is important to consistently monitor these streets and check for potholes or other structural deficiencies until the street is eventually rebuilt.

Very Poor PCI = 25 to 40) – Last Opportunity for Surface Base Rehabilitation

W Luke Ave from N 52nd Ave to N 53rd Ave (GISID 3373, PCI = 27) – Rated as *Very Poor*, this segment still has some remaining life before it becomes a critical reconstruction need. As evident in the imagery, a fair amount of the segment contains block cracking. If left untreated a partial to full reconstruction would be required within a short period of time.

On heavily trafficked roadways, *Very Poor* streets often require partial to full reconstruction. On local roadways, they require removal of the pavement surface through grinding or excavation, base repairs, restoration of the curb line and drainage, and then placement of a new surface.

Poor (PCI = 40 to 50) – Thicker Overlays

N 79th Ln from W Myrtle Ave to W Orangewood Ave (GISID 11284, PCI = 46) – On this street, the primary cause of deterioration is widespread longitudinal and transverse cracking. The center of the road displays deep cracking that extends to the edges of the pavement.

Poor streets that display high amounts of LAD are selected as a high priority for rehabilitation as they generally provide the best cost/benefit ratio to the City. If left untreated, Marginal streets with high amounts of LAD will deteriorate to become partial reconstruction candidates. Marginal streets that are failing due to materials issues or non-load associated failures may become suitable candidates for thick overlays if deferred, without a significant cost increase.

Marginal (PCI = 50 to 60) – Thin to Moderate Overlays

N 46th Ave from W Cheryl Dr to W Beryl Ave (GISID 9729, PCI = 54) – *Marginal* streets tend to have distresses that are localized and moderate in severity; however, the distresses will predominately be non-load related (i.e., caused by environmental or other factors). This street has minor block cracking that covered dispersed sections of the pavement.

Marginal streets can provide a good cost/benefit ratio to an agency if addressed with an adequate rehabilitation technique. Stretching the application for surface treatments into this range can pose a cheap alternative to overlays but does not provide the appropriate renewal to the structural capacity of the pavement and may allow load related deterioration to continue unabated.

Fair/Critical (PCI = 60 to 70) – Surface Treatments with Localized Rehabilitation

N 50th Dr from W Mountain View RD to W Ironwood Dr (GISID 5926, PCI = 65) – Rated as *Fair/Critical*, the primary causes of deterioration for this street are the sections of dispersed longitudinal and transverse cracking. The pavement surface could be restored with spot patching to fully waterproof the pavement.

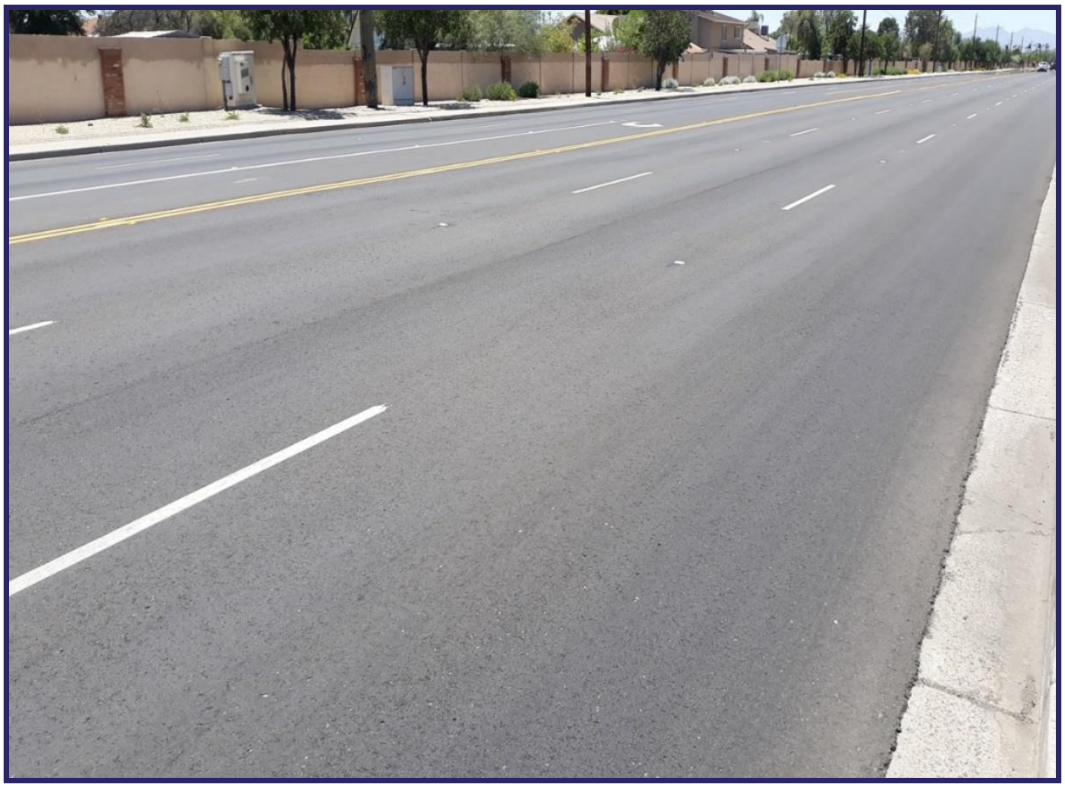
Preventive measures on streets considered Good can have a positive impact on the City's funding needs. While the expected life of a slurry seal is not as long as that of an overlay, its ability to slow deterioration and relative low cost can free up funding for streets in worse condition.

Good (PCI = 70 to 82) – Surface Treatments and Localized Rehabilitation

W Kings Ave from DS@40W N 51st Ave to N 51st Dr (GISID 8687, PCI = 75) – Rated as *Good*, this street displays minor amounts of longitudinal cracking. It is an example of a candidate for preventative maintenance such as microsurfacing to extend the life of the roadway.

Also, routine maintenance prevents water intrusion by sealing and slowing crack growth. By keeping water out of the base layers, the pavement life is extended without the need for heavier rehabilitations.

Excellent (PCI = 82 to 100)



W Cactus Rd from N 61st Ave to N 62nd Dr (GISID 5856, PCI = 100) – Rated as *Excellent*, this pavement displays little to no surface distresses. The ride is smooth, and the surface and the base are intact. Excellent roads should be periodically assessed for crack development that would trigger routine maintenance activities.

4.2 City Network Condition Distribution

Figure 10 shows the distribution of pavement condition for the roadway network in Glendale. The City is currently responsible for approximately 774 centerline miles of pavement with an overall PCI of 58.

- Approximately fourteen percent (14%) of the network can be considered in *Excellent* condition and should be closely monitored to ensure timely application of early localized preventative measures.
- Approximately sixteen percent (16%) of the network falls into the PCI range considered *Good*. These are roads that benefit most from preventative maintenance techniques such as spot patching and slurry seals.
- Approximately twenty-one (21%) of the streets are rated as *Fair/Critical* and may still be candidates for slurry seals or thin overlays if structurally in sound condition with minimal LADs.
- Approximately twenty-five percent (25%) of the network can be considered in *Poor* to *Marginal* condition and represents candidates for progressively thicker overlay-based rehabilitation. If left untreated, they will decline rapidly into reconstruction candidates.
- Approximately twenty-four percent (24%) of the network is rated as *Failed* or *Very Poor*, meaning these roadways have deteriorated to the point where surface rehabilitation such as mill and overlays can no longer restore the pavement to a point of structural adequacy. Reconstruction of the surface layer or entire pavement structure is required for these segments which costs about $133M in present value.

Figure 10 - Roadway Network Present Status Using Descriptive Terms

4.3 Condition By Functional Classification

Analyzing subsets of data in addition to the overall pavement condition can provide a better understanding of where an agency should focus its resources. **Figure 11** displays the distribution of pavement functional class for the pavement network and **Table 4** provides a summary of pavement conditions per functional class.

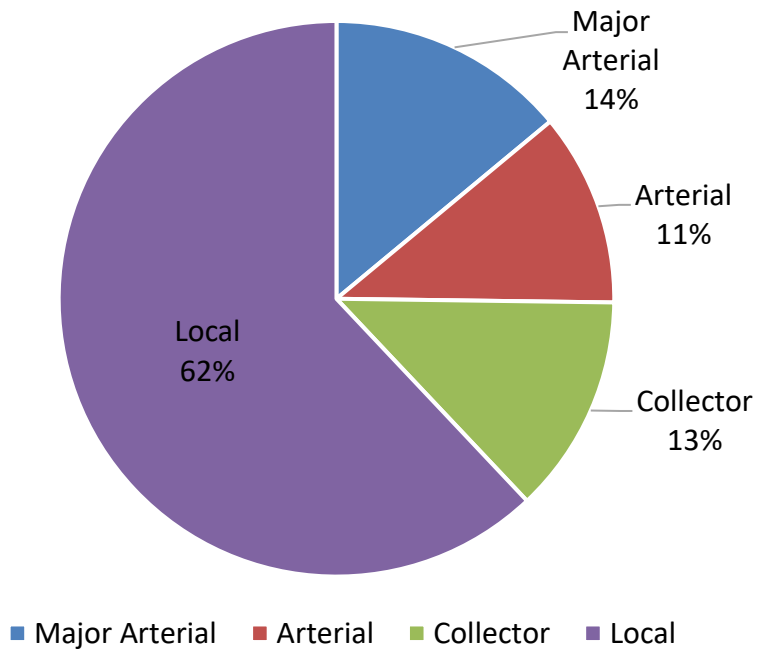


Figure 11 – Network Distribution of Functional Class

Collector roads have the highest average PCI of 64, and arterial roads have the lowest average PCI of 54. Major arterial and local roads have PCIs of 58 and 57, respectively. **Appendix B** provides details of the street inventory and conditions per Segment.

Table 4 - Summary of Pavement Conditions per Functional Class

Functional Class	Area (SY)	Length (Mile)	PCI
Major Arterial	2,499,961	65	58
Arterial	2,008,287	62	54
Collector	2,280,652	91	64
Local	11,092,455	556	57
All	15,829,355	774	58

4.4 Pavement Condition Metrics

- **Average PCI** – The network's average PCI is a global indicator of the overall condition of the network. The City's average PCI is currently below the national average observed among IMS clients, which is 65.

- **Backlog** – The percentage of pavements with a condition category of *Very Poor or Failed* with a PCI below 40. These are the roads that typically require either a partial or full reconstruction. Maintaining a low level of backlog allows for a more cost-effective pavement management program. The City's current backlog is about 24% of the network area, costing about $133 million in present value. This is above the nationwide average backlog of 11% of the network.

4.5 Summary

Section 4 of the report provided a detailed analysis of the results obtained from the pavement condition survey conducted in the City of Glendale. The section covered the functional classifications represented in the City and their respective PCI values, which were further illustrated with pavement photographs taken during the survey. **Overall, the network average PCI for Glendale was found to be in Marginal condition with a PCI of 58 and with 24% of pavements with a PCI below 40. This backlog of Poor and Very Poor streets costs the City about $133 million to reconstruct.**

5 REHABILITATION PLAN AN BUDGET DEVELOPMENT

This section discusses the results of the pavement management analysis that was performed using the PAVER pavement management system, starting with an overview of the assumptions that were used when implementing the system. Some of these include the accuracy of unit rates and the selection methodology for rehabilitation candidates. The subsequent Section, 5.2, details the results of each of the various budget runs, along with their predicted conditions. Budgets are presented in five- and ten-year models.

5.1 Key Analysis Set Points and Assumptions

The PAVER program requires user inputs to complete its condition forecasting, prioritization, and budget analysis. The M&R analyses were based on the results of the December 2022 PCI survey and the pavement inventory and historical work records provided by the City and stored in the City's PAVER database. The other assumptions made in our analyses include:

- **Pavement Performance Curves**: Pavement performance curves (aka deterioration curves) are used to predict future pavement conditions. PAVER allows for historical M&R and inspection data to be used to build deterioration models that reflect actual pavement conditions over time for pavement families that share similar characteristics (e.g. functional class, pavement use, pavement type, pavement strength, AADT, soil properties, and construction methods).
- **Critical PCI**: PAVER allows the user to pick a point in the pavement performance curve where rehabilitation is deemed most necessary. The Critical PCI value represents the condition at or below which Major M&R (e.g., resurfacing and reconstruction) is typically recommended. A PCI value of 55 has been chosen for all the City's roadways as this numerical value is in the middle of the *Marginal* condition category in the City's PCI scale. Performing major M&R on pavements that are closer to the critical PCI of 55 through resurfacing, rather than waiting for these pavements to deteriorate further to reconstruction is generally more cost effective and is prioritized in PAVER.
- **M&R Categories, Rates, and Policies**: PAVER groups M&R activities into two categories designated as Major and Global Preventive. **Table 5** lists rehabilitation activities lowest to highest estimated cost.
    - Global Preventive M&R: includes surface treatments such as Slurry Seal. This treatment should be applied to pavements in good or satisfactory conditions with minimal LAD. These activities will provide a bump in the PCI through providing a credit in the age of the pavement (typically around 5 years).
    - Major M&R: major M&R include structural overlays, mill and overlays, and partial and full reconstructions activities and reset the PCI to 100.

Selection and Prioritization of Rehab Candidates

- **Priority ranking**: analysis in PAVER uses prioritization for rehabilitation candidate selection based on segments Use and Rank. In the program "Use" defines the role the pavement plays (Roadway, Parking Lot, Driveway), while "Rank" defines its functional class. Since this project only focused on roadways, the prioritization will be entirely based on Rank. Generally, higher traffic functional classes receive a higher priority. This ensures that roadways that service the most residents undergo rehabilitation first to provide as much benefit per person as possible.
- **Proximity to Critical PCI**: when selecting major M&R candidates for pavements below critical PCI, pavements with PCI values closer to the critical PCI of 55 receive a higher priority to allow for more resurfacing projects, rather than waiting for these pavements to deteriorate further to become reconstruction candidates.
- **M&R Categories**: When funding is limited, PAVER always prioritizes preventive maintenance over major M&R work to be able to keep good pavements in good condition for a longer time and slow down the network level deterioration.

The net result of the multi-year plans is a program that favors global surface treatments, followed by moderate to thick overlays, then partial reconstruction projects, and finally full reconstruction projects.

Table 5 – Rehabilitation Strategies and Rates

Code	Rehab Activity	Estimated Cost	Units
SS-RE	Surface Seal - Rejuvenating	$0.22	SqFt
SC	Sealcoat	$0.44	SqFt
ST-SS	Surface Treatment - Slurry Seal	$0.56	SqFt
Chip Seal	Chip Seal	$0.78	SqFt
Microseal	Microseal	$0.83	SqFt
Chip&SC	Chip Seal + Sealcoat	$1.00	SqFt
ST-CS	Surface Treatment - Cape Seal	$1.11	SqFt
OL-AT	Overlay - AC Thin (1 in)	$1.20	SqFt
OL_1.5	1.5 in overlay	$1.78	SqFt
MOL-2	Cold Mill and Overlay - 2 Inches	$2.33	SqFt
MOL-3	Cold Mill and Overlay - 3 Inches	$2.67	SqFt
CIR	Cold In Place Recycling	$5.56	SqFt
Conv Recon	Conventional Reconstruction	$12.22	SqFt

5.2 Network Budget Analysis Models

The pavement management analysis using the PAVER system involved combining the condition assessment, deterioration model, prioritization factors, and rehabilitation assignments to conduct a budget analysis. With this information, the program can predict the outcomes of different funding levels or suggest the funds necessary to achieve specific goals. The City requested that the annual budget necessary to maintain the current PCI, to reach a PCI of 72 in 5 years and in 10 years, and to reach a PCI of 82 in 5 years and in 10 years be identified for budget planning purposes. To model network trends and estimate the funding levels needed to reach certain condition and distribution targets, IMS conducted an analysis using a series of budgets and target PCIs. The results of this analysis are detailed in this section. In these analyses, a 5% inflation rate was considered for future maintenance costs.

Budget Necessary for PCI Targets

The following scenarios shown in **Table 6** were generated to predict the budget necessary in order to reach a specific PCI target over the next five and ten years. These models help the City determine what level of funding may be appropriate moving forward.

The City's goal is to improve pavement conditions to *good* condition (70-82), to reduce expenses and optimize its budget for extending the pavement's lifespan. To reach PCIs of 72 and 82 within a decade, the City would need to allocate approximately $31 million and $36 million annually, respectively. Achieving these targets within a shorter 5-year period would require an annual budget increase to around $42 million and $52 million, respectively. It is important to note that these projections are estimated using 5% annual inflation rate.

To get the most return on investment, IMS presents the following recommendations based on the data analysis outcome:

- Continue dedicating a portion of funding to inexpensive preventive maintenance activities, such as slurry seals; and monitor their short- and long-term benefits in the network. For these activities, make sure to apply them on good roads with minimal structural defects or properly address the structural deficiencies through localized patching and crack sealing prior to slurry seal application.
- Concentrate rehabilitation activities on the critical PCI candidates selected by PAVER for various work categories. PAVER recommendations are focused on roads that are at their "Critical PCI" point. These are roads that will soon deteriorate to a point where heavier rehabilitation may be necessary.

This approach allows for a gradual increase of the network's average PCI and decrease of the roads in *Poor* or worse condition.

Table 6- Projected Post PCI Based on Annual Budget and Duration

Duration (Years)	Post PCI	Annual Budget ($M/Yr)
5	58	12.5
5	72	41.7
5	82	51.5

Duration (Years)	Post PCI	Annual Budget ($M/Yr)
10	58	20.8
10	72	31.0
10	82	35.9

Current City Budget Model Predictions

The City's current annual budget for pavement maintenance and rehabilitation is $30M on average. This funding includes PMP budget and bonds**. Table 7** shows the approximate average PCI after following the City's rehabilitation plan for 5 and 10 years. In five years (FY28), it is anticipated that this budget level will result in an approximate PCI improvement to 63 for the network. Looking ahead ten years (FY33), it is expected that the network PCI will continue to rise, reaching approximately 70. **Table 8** presents the City's current plan for their annual budget across ten years. The City is projected to raise its network condition to *Good* after a period of ten years if it follows a priority-based strategy for pavement management.

The table provides an estimated mileage that the City can rehabilitate and maintain on a yearly basis assuming a 5% inflation rate, and its target mileage estimated at present costs with no increase in annual costs. To maintain a target annual mileage of roads to rehabilitate, the city must adjust its annual budgets to account for future inflation. These network level estimates can change based on the actual rehabilitation strategy that needs to be applied and other project level ancillary costs (e.g. curb and gutter, sidewalks, ramps, landscaping, striping, etc.).

Table 7 - Current City Funding

Duration	Post PCI	Annual Budget ($M/YR)
5	63	30
10	70	30

Table 8 - Current Plan for Annual Budget Per Fiscal year

Fiscal Year (FY)	PMP Budget (Transportation Sales Tax & HURF) ($M*)	Bond Budget ($M)	Total Budget ($M)	Approximate Mileage to Rehab Based 5% Inflation rate	Approximate Target Mileage to Rehab Based on Present Costs

5.3 Summary

The analysis conducted using the PAVER program demonstrated that the existing annual pavement management budget of $30M would lead to an overall improvement in pavement conditions over both a five-year and ten-year timeframe. It is crucial for the City to adopt a priority-based strategy to maximize the effectiveness of the allocated budget. While the City's ultimate objective is to elevate the pavement network's condition to an *Excellent* rating, this isn't feasible with the current budget. To achieve that goal, the City would need to consider increasing the annual budget to approximately $35.9 million.

To get the most return on investment, the City needs to continue dedicating a portion of funding to inexpensive global preventive maintenance activities, such as slurry seals; and monitor their short- and long-term benefits in the network. On the other hand, the City should also concentrate rehabs on the segments close to critical PCI of 55 selected by PAVER for mill and overlay projects. These marginal roads, if delayed, will soon deteriorate to a point where heavier reconstruction may be necessary.

This approach allows for a gradual increase of the network’s average PCI and decrease of the backlog of roads in *Very Poor* or *Failed* condition.

6 PROJECT RECOMMENDATIONS AND COMMENTS

6.1 Project Summary and Recommendations

A pavement condition survey was performed at the end of 2022 on the City 774 centerline miles of pavement network. The results of the condition survey were aggregated into the PAVER pavement management system along with available historical inspections and work history dating back to 1968. This system facilitated the creation of a georeferenced pavement inventory, enabled the development of a precise model of the network's current condition and anticipated future deterioration, and provided recommendations for funding to meet a selection of PCI objectives over a period of five and ten years.

These recommendations were based on data from surveys completed in December 2022. For segments that had received a slurry seal in the past 3 years, PAVER program's estimated benefits (5 years credit) were used to project the PCI.

The following recommendations are presented to the City as an output from the pavement analysis and must be read in conjunction with the previous sections.

- The City should make efforts to keep the PAVER database up to date.
    - By maintaining and updating the rehabilitation unit rates, work history of the segments, and accuracy of the inventory, the City will be able to reliably forecast funding needs for future years. This allows the City to be proactive in maintaining the condition of the pavement network at an acceptable level.
- The City should periodically resurvey the pavement network.
    - Pavement performance over time involves many variables, such as traffic volumes, environmental factors, maintenance timing, and design standards. As these variables change, the rate at which a pavement deteriorates will change with them. The periodic resurvey of pavement conditions allows the City to track these changes and update models, accordingly, ensuring that appropriate rehabilitation measures are being planned.
- The City should investigate the effectiveness of its currently implemented pavement M&R practices and investigate the use of new and additional rehabilitation activities.
    - Advancements in pavement rehabilitation technology are constantly being made, and it is recommended that the City periodically update its choices of M&R activities in the network to take advantage of these advances.
- The City should strive to maintain or improve its current condition using a priority-based pavement maintenance and rehabilitation strategy.
    - Maintaining a pavement network in good condition is more cost-effective than restoring conditions after deterioration has occurred. The City's current pavement network has an overall PCI of 58 with a percentage of pavements with a PCI below 40 of 24% ($133M in present value). Using a priority-based approach, the City is projected to achieve a PCI of 70 in ten years with its current annual budget of $30M. This projection accounts for 5% inflation rate in future costs.

- The City should consider increasing the annual budget to reach its final pavement management goal of a PCI of 82.
    - The models show that the annual budget must be at least $35.9M to reach a PCI of 82 after ten years. This target PCI is not obtainable with the current budget.

6.2 Closing

The IMS Team greatly appreciates the opportunity to work with the City on this pavement management update. Over the course of this project, the team has observed the City staff's dedication to offering the best possible service to their community. IMS stands ready to assist the City with training and technical support as necessary and welcomes the opportunity to work with the City on future pavement management projects.
